

InfoGenesis POS - the smart choice

When business depends on a reliable and functional point-of-sale solution, InfoGenesis POS is the smart choice. With over 25 years experience in developing and supplying POS systems to the hospitality industry, InfoGenesis has developed a POS application that gives you the tools to improve your bottom line.

From system up-time to transaction management, InfoGenesis POS addresses all your needs consistently and positively.

InfoGenesis POS is built on industry standard technology utilising client server architecture, Microsoft Windows and a centralised relational database. It delivers the functionality you require, and grows with your business.

The InfoGenesis POS Windows Terminal Application is a feature rich POS application that is utilised by over 8000 businesses in the hospitality and foodservice markets across the globe.

Reliability & Scalability

Key to the InfoGenesis POS system is its inherent 'fail-safe' architecture. If for any reason the terminals lose communication with the host server, they will continue to operate uninterrupted, allowing local services to recall and process open tables and to run balancing reports.

When communications to the host server are restored, transaction details are automatically uploaded to the back office. This reliability means the system can also run in remote locations eg: outdoor functions where cabling or wireless access may not be available.

Extensive choice of hardware

The InfoGenesis POS application operates on any PC based hardware, offering a whole range of hardware options. From the renowned quality of the IBM Touch Screen Terminal to Hand Held Terminals, InfoGenesis has the hardware solution to suit your requirements.

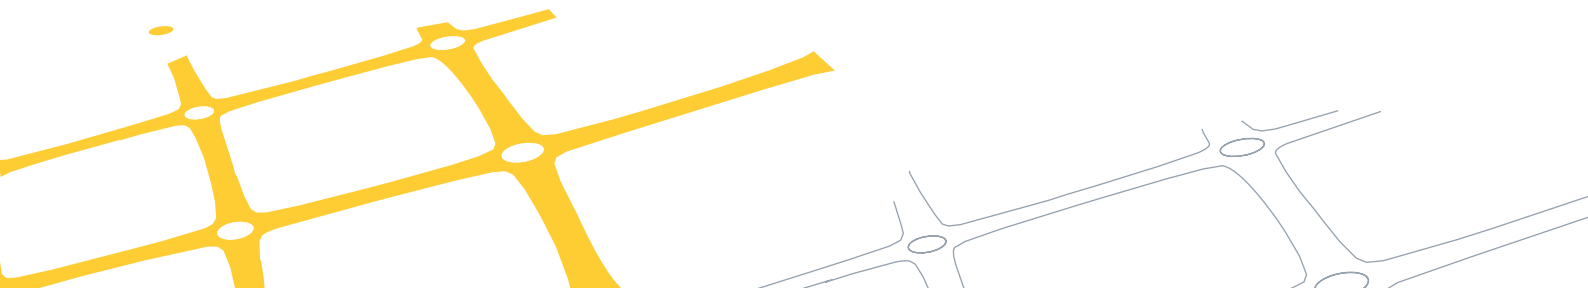

In addition to the POS terminal hardware a wide range of peripherals are also available, including compact cash drawers, printers, bar code scanners, scales, proximity readers and smart cards.

Seamless Integration

InfoGenesis POS integrates seamlessly with most other management information systems including Property Management, Gaming, Inventory and Financial Systems.

Customisation

InfoGenesis can be tailored to suit your business, catering to the requirements of retail, bottle shop, bar, concession, bistro and fine dining operations. Screens can be custom built for each outlet, serving period, or employee, ensuring employee proficiency as they spend less time learning the system, and more time serving your customers.

Cashless Flexibility

The need to provide quick and seamless payment methods to your customers has never been stronger. InfoGenesis offers a diverse range of payment options from integrated EFTPOS and credit card, to point reward and redemption using points accumulated via loyalty programs.

From an operational standpoint, credit and debit cards streamline the sales process and increase your average transaction revenue potential. Customers are served faster and the overhead and security issues associated with managing cash are significantly reduced.

InfoGenesis POS offers integrated point reward and redemption interfaces to all major suppliers of gaming systems. Customers can be rewarded with points on all purchases, as well as point redemption at any POS terminal. Functionality can also be extended to include: automatic discounts, price level changes and member tracking.

The cashless module within InfoGenesis POS has limitless application within the hospitality and food service industry. Hospitals and corporate cafeterias are using the cashless module for employee purchases with automatic payroll deduction. Clubs, theme parks and hotels are using it for staff meals, loyalty program rewards and pre-programmed-value smart cards.

Configuration Module

Comprehensive and easy to use options within the Configuration Module help create the ideal POS system for your business.

With flexible menu and pricing control, InfoGenesis POS ensures manual practices are a thing of the past. Each product can support up to 256 different price levels that can be forced or automatically changed at certain times of the day. Menus can also be set to change according to pre-determined serving periods, from lunch to dinner, even down to specific terminals.

InfoGenesis POS gives you complete control over your screen design. The design wizard allows you to layout any menu item, feature or function to any screen. Customisation includes being able to set the size of, shape, font and colour of each key creating an intuitive POS operation which is easy for new staff to follow.

Reporting Module

The reporting module provides a list of standard reports that cover all aspects of your operation. All transaction information from the POS terminals is posted into a relational database in real-time. The reporting module sorts the information and displays the results in over 300 standard reports covering costs, sales, audit and financial details.

POS data is stored within an efficient SQL database, giving you access to operation critical, up to the minute information, on demand. A report schedule is also available which can be set to automatically send 'favourite' reports to a printer, file or email. Integration to Microsoft Office and third party report writers also provide additional means of creating your own reports.

InfoGenesis – at the heart of hospitality

InfoGenesis technology helps run leading hospitality and food service operations in Australia and throughout the world. With over 8000 installations worldwide, from corporate cafeterias, hotels and clubs, to stadiums, restaurants, theme parks and casinos, InfoGenesis is the proven solution.

InfoGenesis

InfoGenesis Inventory Control

The core to any successful business within the hospitality industry is having effective control over the largest cost to business: inventory.

Adding the right percentage to cost control impacts directly upon a business bottom line and provides one of the most effective ways to add revenue to the business financials.

InfoGenesis Inventory Control (IC) is a feature-rich inventory application that simplifies stock management and gets inventory costs under control.

Managing Inventory

InfoGenesis IC's inventory maintenance module is designed specifically for the hospitality and food service industry. Purchasing units are set-up to meet the requirements of suppliers then transformed into stock units (including stocked and non-stocked recipe units) and products that are sold onto customers.

Stock movement and control

InfoGenesis IC manages stock movement and control via its purchasing and receiving modules.

The system suggests purchase orders based on par levels or seasonal sales history and automatically recalls the order upon delivery. Stock transfers from dry goods or the cellar are also easily facilitated via a PDE (Portable Data Entry Unit).

Partial and full stock takes are available by cost centre with count sheets or automatically via the PDE units.

Sales generated at the POS terminal automatically decrement stock levels, using recipe configurations to decrease the correct ingredients. This provides complete control over your stock alongside the ability to enquire on stock levels in real time.

Pricing of products can be done individually or in bulk with options for a dollar amount or percentage change. Inventory costing options include: last invoice cost, first in first out and weighted cost.

Integration with finance and supplies

InfoGenesis IC integrates to most popular financial systems for accounts payable and general ledger, including Sun, Great Pains, Attaché, Myob and Adept.

Outside of these, InfoGenesis can create customer-specific, XML-based integration to many industry standard finance systems, providing a cost-effective way of transferring data between systems.

Completing the automation process, InfoGenesis IC offer interfaces to suppliers for invoicing and price book control. Australian Liquor Marketers, Independent Liquor Group and Hotel Liquor Wholesalers are all certified with InfoGenesis IC.
